The Java Servlet API is a Standard Extension to the Java platform that provides web application developers with a simple consistent mechanism for extending the functionality of a web server.

Servlet Tutorial. Servlet technology is used to create a web application (resides at server side and generates a dynamic web page). Servlet technology is robust and scalable because of java language. Before Servlet, CGI (Common Gateway Interface) scripting language was common as a server-side programming language. Java Servlets are server-side Java program modules that procedure and answer customer demands and actualize the servlet interface. It helps in improving Web server usefulness with negligible overhead, upkeep and support. A servlet goes about as a mediator between the customer and the server. Servlets provide a component-based, platform-independent method for building Webbased applications, without the performance limitations of CGI programs. Servlets have access to the entire family of Java APIs, including the JDBC API to access enterprise databases.

A servlet is a Java programming language class used to extend the capabilities of servers that host applications accessed by means of a request-response programming model. Although servlets can respond to any type of request, they are commonly used to extend the applications hosted by web servers.
